Prompt:
Analyze the original Shopizer ZIP, the modified Shopizer ZIP containing three evolution changes, and the Part 3 reference ZIP (A9_Reviewed_Clean.zip), which contains the Observer and Strategy implementations in Python, JavaScript, Java, and C++.

Prepare an evidence-based report covering: .
1, Application description: what Shopizer is, its main modules and its purpose.
2. Framework architecture: layers, such as controller/service/repository, Spring Boot configuration and dependency injection.
3. Pattern inventory: a table with pattern, category, and status (Present in original / Introduced by modification / Proposed only).
4. Pattern-to-source mapping: for each pattern, the participating classes and interfaces and their roles. Pay special attention to Observer and Strategy, since those are the two we implemented.
5. Source-code evidence: exact file paths, line numbers and short snippets (under about 10 lines), with the version noted (original or modified).

Compare original and modified versions wherever relevant. Classify each pattern as Present in original, Introduced by modification, or Proposed only. Confirm patterns through actual code structure and behavior, never class names alone. Clearly distinguish implemented patterns from proposals, acknowledge insufficient evidence, and do not modify the source ZIPs or the four-language reference implementations.

Output:

Prompt:

Implement the Observer and Strategy design patterns in Python using VS Code, with the goal of reproducing the same functionality in JavaScript, Java, and C++ later.

First, define the language-independent requirements, expected behavior, and test cases, including edge cases and expected outputs. Use Observer for order-status notifications via SMS and Strategy for interchangeable payment methods.

Then implement each pattern step by step in Python, explain the code, execute the tests, verify the results, and prepare a reusable specification and test suite for the other three languages. Do not begin coding until the requirements and test cases are defined.
